

Kurbo's fabric expansion joint designs will fall into two basic types; single layer type or composite type. Within the two basic types, Kurbo's fabric expansion joint is manufactured either in a belt type or integral molded flange type.

An important consideration in selecting Kurbo's fabric expansion joint is the system temperature. In general, there are two classifications: those operating under 200°C (typically elastomeric) and those operating above 200°C (typically composite)

Belt Type Expansion Joint

Integrally Flanged Type Expansion Joint
